## Содержание

1	Цели работы	3
2	Программа работы	3
3	Разработка генератора	3
4	Выводы	8
	Приложение 1. Исходный код	8

## 1. Цели работы

Сформировать набор данных, позволяющий производить операции на реальных объемах данных.

## 2. Программа работы

1. Реализация в виде программы параметризуемого генератора, который позволит сформировать набор связанных данных в каждой таблице.
2. Частные требования к генератору, набору данных и результирующему набору данных:
  - количество записей в справочных таблицах должно соответствовать ограничениям предметной области
  - количество записей в таблицах, хранящих информацию об объектах или субъектах должно быть параметром генерации
  - значения для внешних ключей необходимо брать из связанных таблиц

## 3. Разработка генератора

Генератор выполнен в виде консольного приложения, разработанного на языке Java последней версии 11.0.1. Программа ожидает 2 аргумента командной строки: путь к файлу в формате `json`, в котором содержатся `url` `Postgres`-сервера, и имя пользователя, и пароль для доступа к нему; и путь к файлу в формате `json`, содержащему параметры генератора. Примеры этих 2-х файлов представлены в листингах 1 и 2.

```
1 {  
2   "url": "jdbc:postgresql://localhost:5432/postgres",  
3   "user": "postgres",  
4   "password": "postgres"  
5 }
```

Листинг 1: Пример параметров доступа к `Postgres`-серверу

```
1 {  
2   "usersCount": 20000,  
3   "femalePercentage": 55,  
4   "moviesCount": 10000,  
5   "seriesCountSeasonsEpisodes": [  
6     [100, 3, 15],  
7     [150, 4, 50],  
8     [200, 2, 25],  
9     [300, 1, 7],  
10    [100, 5, 10]  
11  ],  
12   "percentageOfUsersWhoBoughtMovies": 64,  
13   "minMoviesPerUser": 5,  
14   "maxMoviesPerUser": 10,  
15   "percentageOfUsersWhoBoughtSeries": 35,
```

```

16 "minSeriesPerUser": 2,
17 "maxSeriesPerUser": 5,
18 "minSubscriptionsPerUser": 3,
19 "maxSubscriptionsPerUser": 10,
20 "durationPriceNMoviesMSeasons": [
21   [30, 5, 5, 1], [60, 9, 5, 1], [90, 13, 5, 1], [180, 25, 5, 1], [365, 40, 5, 1],
22   [30, 7, 10, 2], [60, 13, 10, 2], [90, 25, 10, 2], [180, 45, 10, 2], [365, 75, 10, 2],
23   [30, 10, 15, 3], [60, 18, 15, 3], [90, 35, 15, 3], [180, 65, 15, 3], [365, 100, 15, 3],
24   [30, 12, 30, 5], [60, 21, 30, 5], [90, 40, 30, 5], [180, 70, 30, 5], [365, 120, 30, 5]
25 ],
26 "moviesSubscriptionsPercentage": 25
27 }

```

## Листинг 2: Пример параметров генератора

Рассмотрим подробнее параметры генератора:

- **usersCount** — число пользователей
- **femalePercentage** — процент девушек от общего числа пользователей
- **moviesCount** — число самостоятельных фильмов (эпизоды сериалов в это число не входят)
- **seriesCountSeasonsEpisodes** — массив типов сериалов, параметризуемый 3-мя значениями: числом сериалов данного типа, числом сезонов в таких сериалах и количество серий в каждом сезоне ([100, 3, 15] означает 100 сериалов, в каждом 3 сезона, состоящих из 15 серий)
- **percentageOfUsersWhoBoughtMovies** — процент пользователей, купивших хотя бы 1 фильм на постоянной основе.
- **minMoviesPerUser** — минимальное число фильмов, которые купил пользователь, входящий в группу, описываемую предыдущим параметром.
- **maxMoviesPerUser** — аналогично предыдущему параметру — максимальное число фильмов.
- **percentageOfUsersWhoBoughtSeries** — процент пользователей, купивших хотя бы 1 сериал на постоянной основе.
- **minSeriesPerUser** — минимальное число сериалов, которые купил пользователь, входящий в группу, описываемую предыдущим параметром.
- **maxSeriesPerUser** — аналогично предыдущему параметру — максимальное число сериалов
- **minSubscriptionsPerUser** — минимальное число подписок у пользователя
- **maxSubscriptionsPerUser** — максимальное число подписок у пользователя
- **moviesSubscriptionsPercentage** — процент подписок на фильмы от общего числа подписок (на фильмы и сериалы)

- **durationPriceNMoviesMSeasons** — массив типов подписок, параметризуемый 4-мя значениями: длительностью в днях, стоимостью в \$, соответствующему числу фильмов и соответствующему числу сезонов сериалов ([90, 35, 15, 3] означает, что подписка на 90 дней, стоимостью \$35, и в неё входят либо 15 фильмов, либо 3 сериала).

Для соединения с базой данных используется JDBC драйвер последней версии 42.2.5.

В качестве системы сборки и управления зависимостями проекта выбран Gradle версии 5.0, конфигурационные файлы проекта написаны на Kotlin DSL. Они представлены в листингах 3 и 4.

```

Листинг 3: build.gradle.kts

```
1 rootProject.name = "datagen"
```

Листинг 4: settings.gradle.kts

Приложение логически разделено на 2 части:

1. Обработка аргументов командной строки и парсинг конфигурационных файлов

Состоит из класса `ArgumentsParser` с бизнес-логикой, исходный код которого приведён в листинге 6. А также классов `EndpointInfo` (листинг 7) и `Parameters` (листинг 8), которые являются моделью для входных json файлов.

Для десериализации json файлов в объекты классов используется библиотека `Gson`.

## 2. Генерация данных и заполнение ими БД

На рис. 3.1 представлена схема БД, состоящей из 16 таблиц.

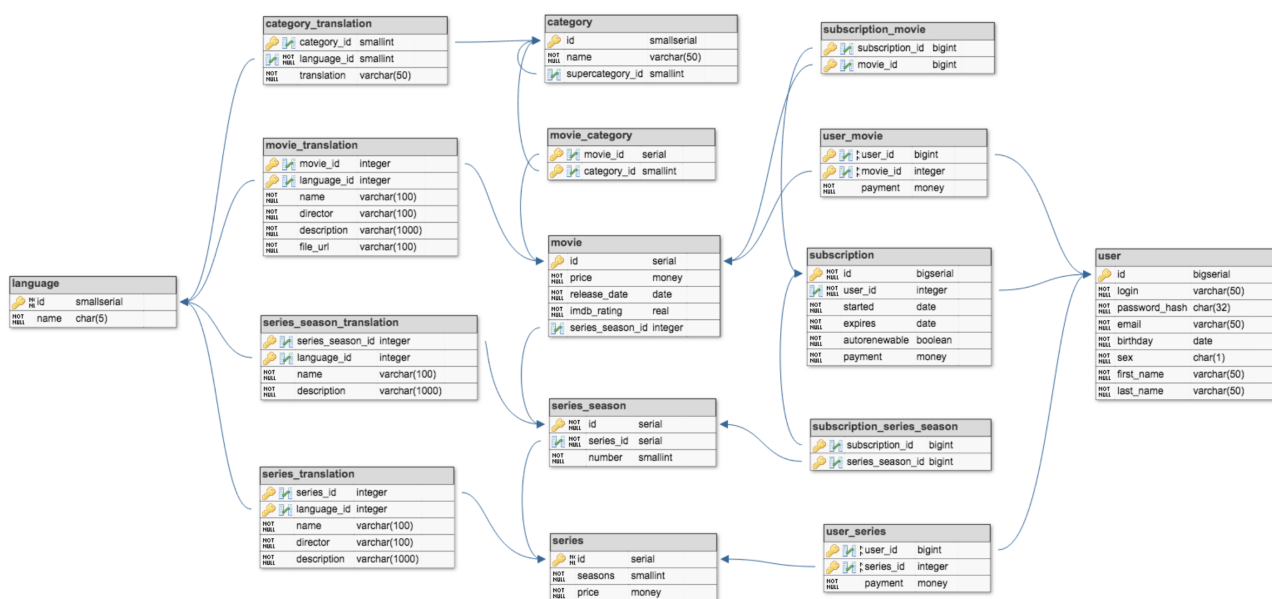

Рис. 3.1: Схема БД

Для заполнения соответствующих таблиц были разработаны классы, реализующие интерфейс `TableGenerator` (листинг 9):

- `LanguageTableGenerator` (листинг 10) — генератор данных для таблицы `language`
- `CategoryTableGenerator` (листинг 11) — генератор данных для таблицы `category`
- `CategoryTranslationTableGenerator` (листинг 12) — генератор данных для таблицы `category_translation`
- `MovieTableGenerator` (листинг 13) — генератор данных для таблицы `movie`
- `MovieTranslationTableGenerator` (листинг 14) — генератор данных для таблицы `movie_translation`
- `MovieCategoryTableGenerator` (листинг 15) — генератор данных для таблицы `movie_category`

- **SeriesTableGenerator** (листинг 16) — генератор данных для таблицы **series**
- **SeriesTranslationTableGenerator** (листинг 17) — генератор данных для таблицы **series\_translation**
- **SeriesSeasonTableGenerator** (листинг 18) — генератор данных для таблицы **series\_season**
- **SeriesSeasonTranslationTableGenerator** (листинг 19) — генератор данных для таблицы **series\_season\_translation**
- **UserTableGenerator** (листинг 20) — генератор данных для таблицы **user**
- **UserMovieTableGenerator** (листинг 21) — генератор данных для таблицы **user\_movie**
- **UserSeriesTableGenerator** (листинг 22) — генератор данных для таблицы **user\_series**
- **SubscriptionTableGenerator** (листинг 23) — генератор данных для таблицы **subscription**
- **SubscriptionMovieTableGenerator** (листинг 24) — генератор данных для таблицы **subscription\_movie**
- **SubscriptionSeriesSeasonTableGenerator** (листинг 25) — генератор данных для таблицы **subscription\_series\_season**

При формировании новых данных иногда требовались данные, уже содержащиеся в таблицах (в частности, значения внешних ключей). Для извлечения из БД этих данных было разработано 2 класса:

- **StorageDAO** (листинг 26) — класс, в котором реализованы **SELECT** запросы к базе данных, позволяющие получить число записей в произвольной таблице или получить все первичные ключи таблицы.
- **SubscriptionTableDAO** (листинг 27) — класс, в котором реализован **SELECT** запрос, специфичный только для таблицы **subscription**.

Также был разработан утилитный класс **Utils** (листинг 28), в котором реализованы вспомогательные функциональности, используемые при генерации данных для разных таблиц.

Для генерации различных данных, таких, как названия фильмов, сериалов, имена пользователей, даты и т.д. использовалась библиотека **JavaFaker**.

## 4. Выводы

В результате работы был разработан параметризуемый генератор, с помощью которого БД была заполнена данными. Эти данные состоят из десятков тысяч пользователей; десятков тысяч фильмов; тысяч сериалов, содержащих, десятки тысяч серий; сотен тысяч подписок...

Также был получен опыт организации взаимодействия Java-приложений с базами данных с помощью стандарта JDBC.
